

I liked this website's layout. The formatting, the pics and style are simple yet sophisticated.

Exercise 2.5: Django MVT Revisited

Learning Goals

- Add images to the model and display them on the frontend of your application
- Create complex views with access to the model
- Display records with views and templates

Reflection Questions

1. In your own words, explain Django static files and how Django handles them.
Django manages static files by allowing developers to organize them in a structured manner during development and by providing tools to prepare them for efficient serving in a production environment. The framework separates static file handling between development and production to optimize performance and ensure proper resource management.

2. Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	It is used to display a list of objects from a queryset. It simplifies the process of listing database records, such as showing all recipes in a recipe app.
DetailView	It is used to display a single object in detail. For example, it can be used to show the details of a single recipe when the user clicks on a recipe link in the list.

3. You're now more than halfway through Achievement 2! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with? You can use these notes to guide your next mentor call.

I am proud of how the Recipe App is coming along so far and the work I have done on it. I am still struggling with some concepts like in this section it was a struggle to link the pages together. I need more practice with images and linking urls in Django.
